DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 15-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bruchmann et al. (DE 101 61 156, citations refer to the English equivalent, US 2005/0043467) in view of Galan et al. (US 4,757,095).

Considering Claims 15-16, 25: Bruchmann et al. teaches aqueous dispersions comprising a polyurethane (¶0001) composed of diisocyanates having 4 to 12 carbons (¶0018), diols of which 10 to 100 mol% have a molecular weight of from 500 to 5000 and 0 to 90 mol% gave a molecular weight of from 60 to 500 (¶0003-5), and monomers containing at least one isocyanate group or at least one isocyanate-reactive group and further carrying at least one hydrophilic group or potentially hydrophilic group (¶0006). The polyurethane is made by preparing polyurethane prepolymers, dispersing them in water, and then chain extending them with polyamines (¶0058).

Bruchmann does not teach preparing the polyurethane in the presence of N-ethylpyrrolidone or N-cyclohexylpyrrolidone. However, Galan et al. teaches using lactones and lactams in the preparation of polyurethanes (Abs). A particularly suited lactam is N-ethylpyrrolidone (6:35-40). Bruchmann and Galan are analogous art because they are from the same field of endeavor, namely polyurethane additives. At

the time of the invention a person of ordinary skill in the art would have found it obvious to have used N-ethylpyrrolidone, as taught by Galan, in the invention of Bruchmann, in order to make a polyurethane product with the unexpected and improved properties when compared to polyurethane elastomers which are prepared in the absence of either a lactone or a lactam, such as good cold temperature flexibility (2:5-15 of Galan).

Considering Claims 17-22: Bruchmann et al. teaches the hydrophilic monomer being dimethylolpropionic acid (§10044).

Considering Claim 23: Bruchmann et al. teaches reacting the monomers in the presence of a cesium salt (§10009).

Considering Claim 24: Bruchmann et al. teaches using the dispersions for coating articles made of plastic, paper, textile, or leather (§10090).
